■ SCOOPCAM

The scoop cam is used to give the mobile unit operator a view of operations while in remote mode. Around bends or at far distances, the unit shows the remote operator on the 10 inch colour screen, not only where the muck is, but shows unwanted spinning tires, or empty buckets! Add the third camera and you can see overhanging boulders or see the hook when recuperating a failed unit.

Our ScoopCam is used with any RRC unit; it works on jumbos, trucks, Drills, Tractors and also for inspections. Inspect ore/waste passes, raises, shafts or any area that you may not want your personnel to access.

■ MICROGUIDE

Our radio remote control is used for operations where the safety of the operator may be in danger. The sturdy electronics has been proven for 12 years. We have used them on scoops, excavators, jumbos and air machines as Cavos or Muck machines. Reliable and efficient, their easy maintenance and install make them the favourites of all our customers.
